

Grocerly

Fresh groceries, less fuss

Platform overview — a complete online grocery ordering and delivery experience: a customer storefront, an operations console for the store team, and a rider app for delivery, all built on one shared system.

What Grocerly Does

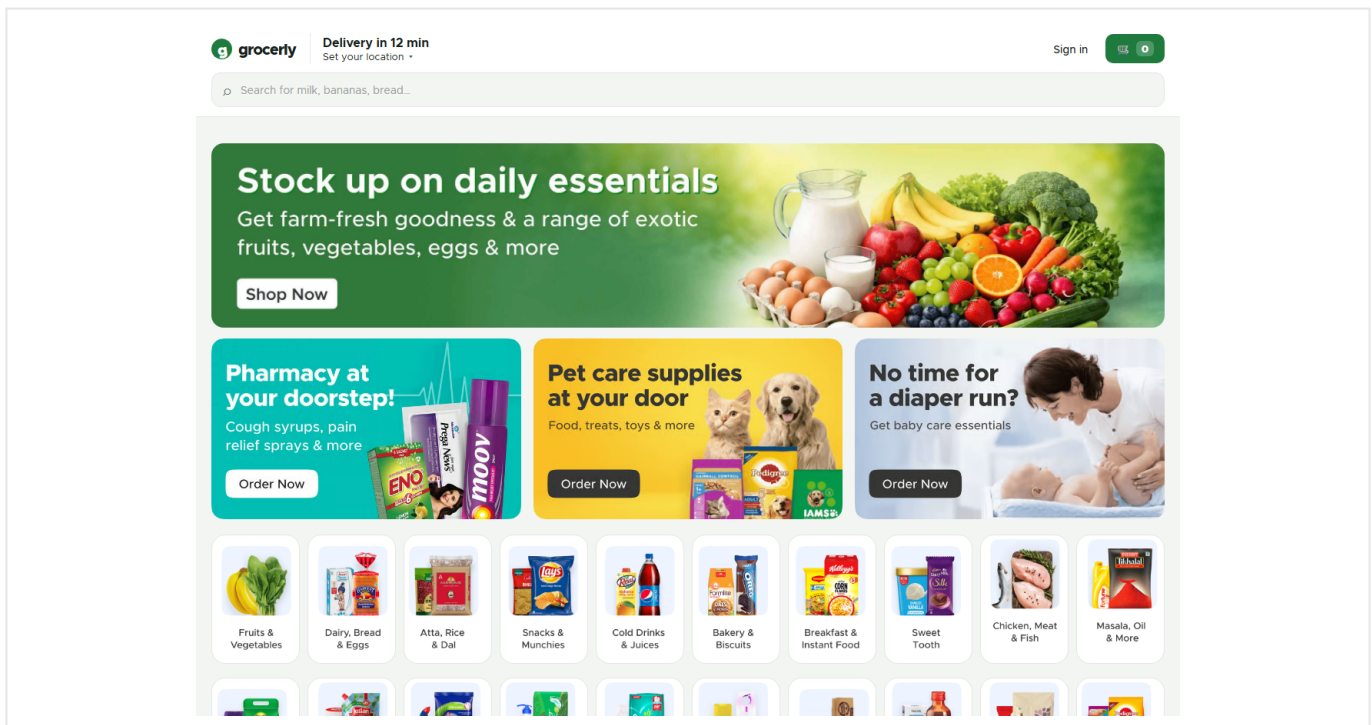

Grocerly is an online grocery ordering and delivery platform, in the style of leading quick-commerce apps. Customers browse categories, order groceries for delivery from their nearest store, and track the order in real time. Behind the scenes, the store team manages inventory, orders and delivery from one console, and riders receive, accept and deliver orders from their own app.

The platform has three parts working together:

- **Customer storefront** — the shopping website (and a matching Android app).
- **Admin console** — the store team's dashboard for orders, products, riders, customers and content.
- **Rider app** — where delivery riders accept offers, navigate, and confirm handover.

Customer Experience

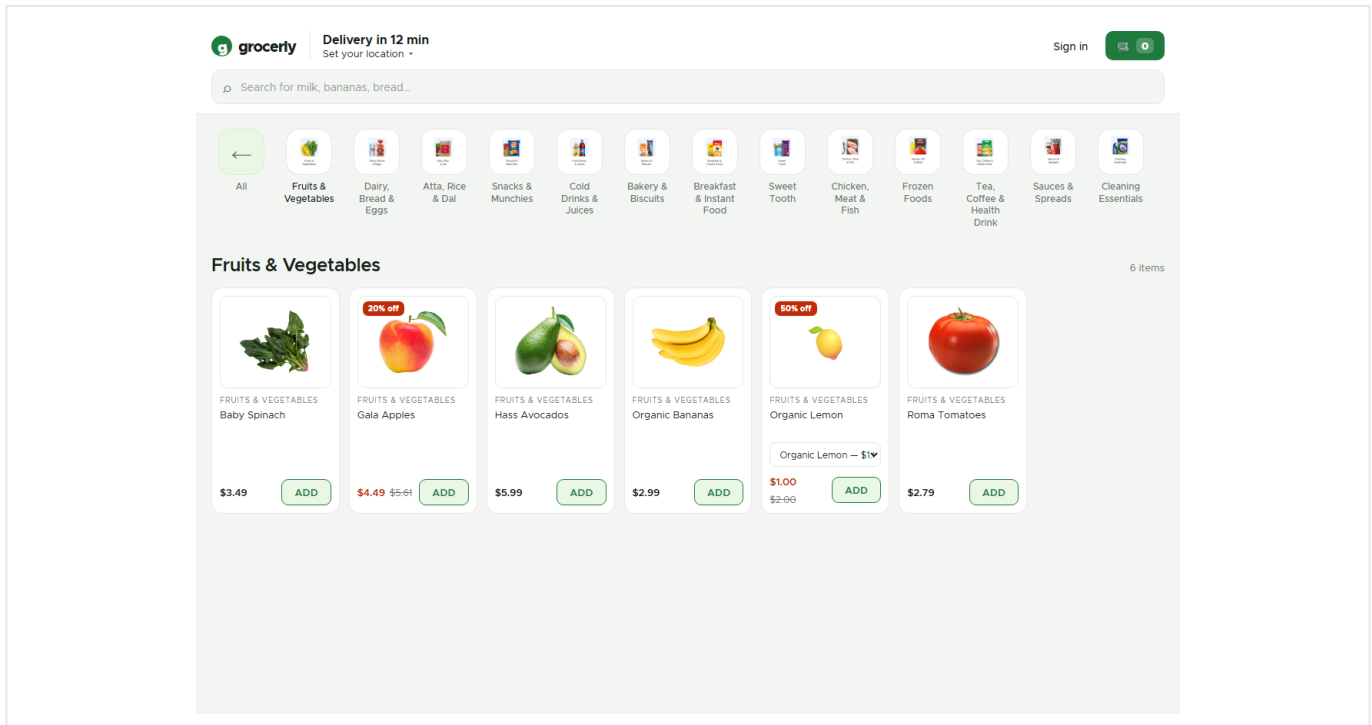

The storefront is a fast, mobile-friendly ordering experience: categories and search up front, clear pricing, and a checkout that adapts to how the customer wants to pay and where they want it delivered.

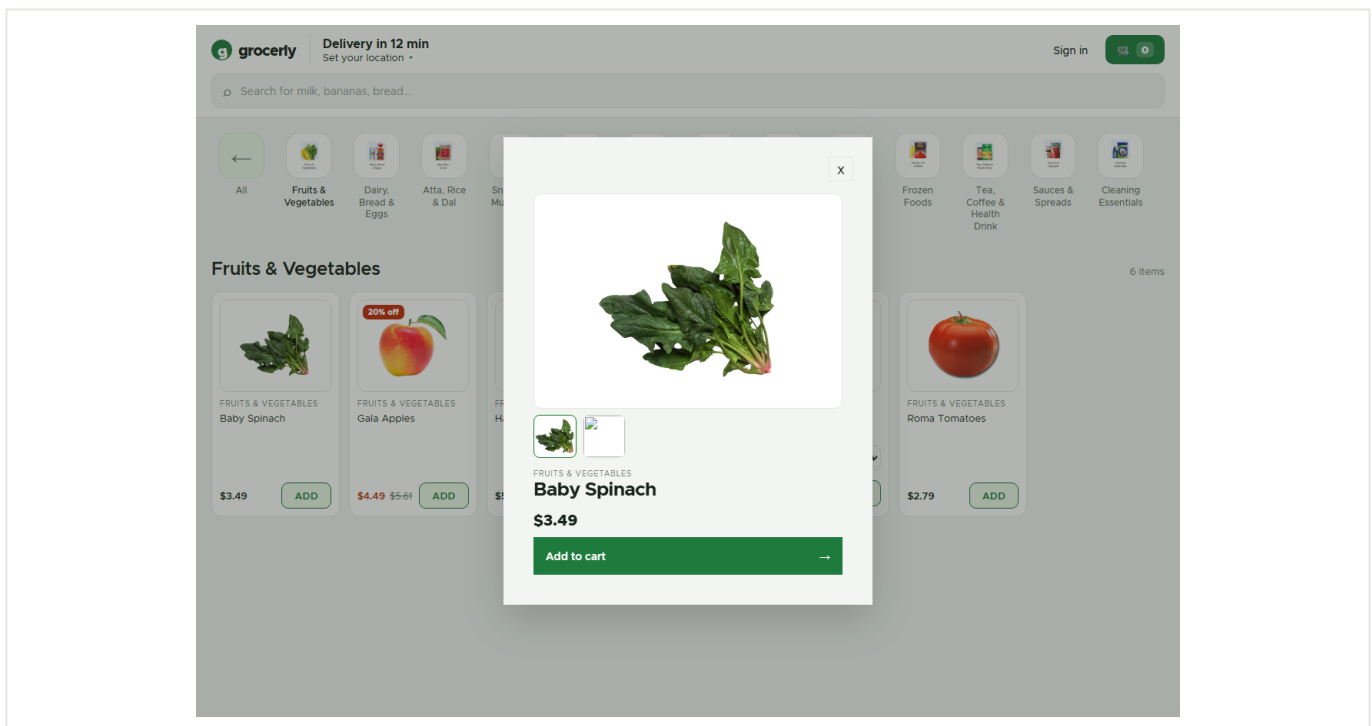

The storefront homepage — banners, categories and search.

- Browse by category or search any product by name.
- Product options (pack size, weight, flavour) with their own price, stock and photo.
- Cart with live subtotal, delivery fee, handling and tax.
- Checkout: saved address or map pin, card payment (Stripe) or cash on delivery.
- Order tracking with live delivery status, and a downloadable PDF receipt.

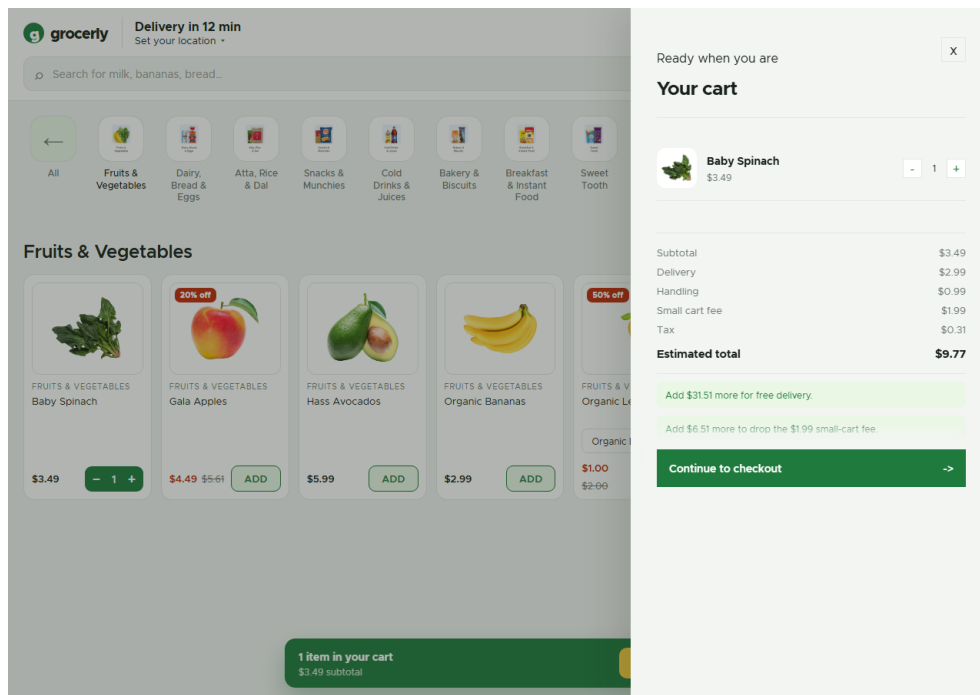

- Support chat — with photo attachments — for any question or issue on an order.
- Rate the delivery rider and the support conversation after the fact.

A category listing — live pricing, discounts and stock.

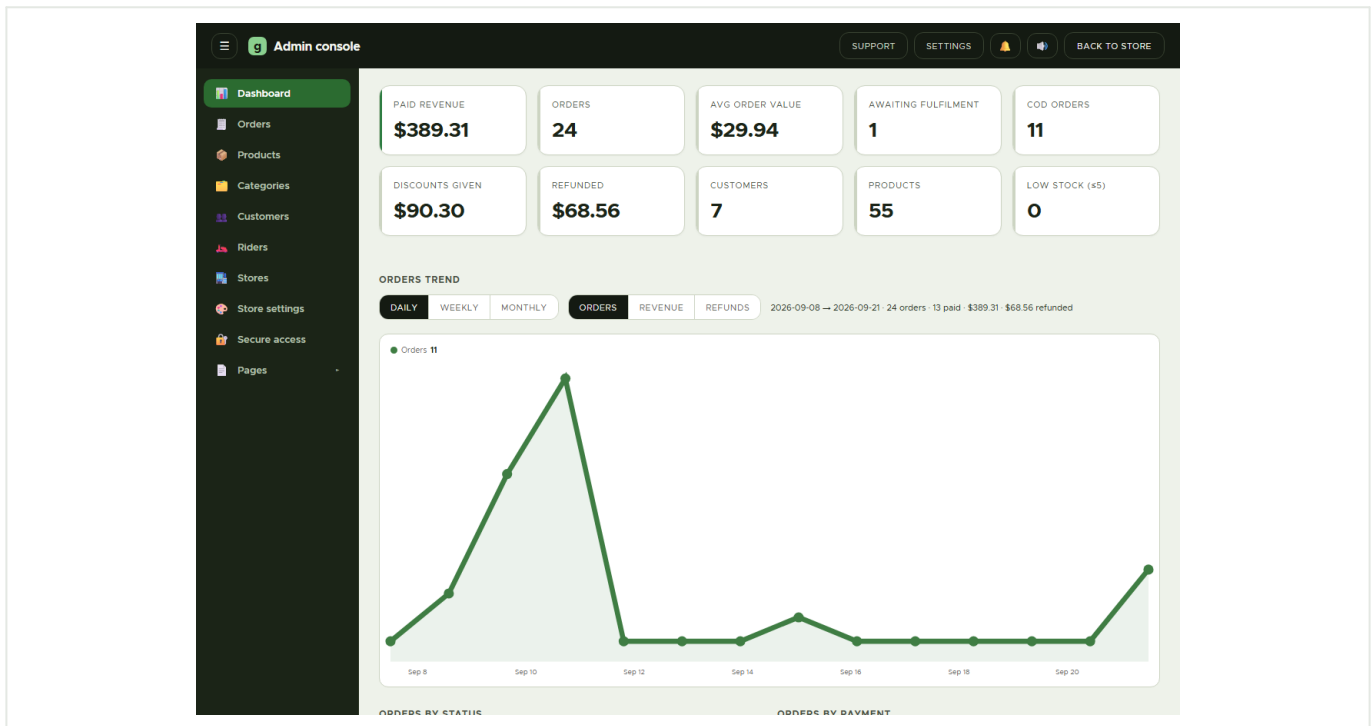

Product detail — options, price and description.

Cart — running subtotal, fees and tax, updated live.

Store Admin Console

Everything the store team needs to run the shop day to day, from one web console: orders, catalogue, riders, customers, and the storefront's own content.

Dashboard — revenue, orders and trend charts at a glance.

- **Dashboard** — revenue, order and customer counts, trend and period-comparison charts, with a notification bell for anything needing attention.
- **Orders** — every order, filter by status, advance the delivery stage, assign a rider, issue refunds or store credit.
- **Products** — price, sale price, an image gallery, size/weight options, and stock tracked per store.
- **Categories, Customers, Stores** — the full catalogue and customer base, and delivery coverage by store and radius.
- **Riders** — hire, assign to stores, track live status, rating and cash-on-delivery balances.
- **Support** — every customer conversation, with refunds/store-credit issued right from the chat.
- **Homepage, Footer & Pages** — banners, category tiles, and every content page (About, Blog, FAQs, etc.) editable without a developer.

Delivery & Riders

Orders ready for delivery are offered automatically to the nearest available rider; the rider accepts, delivers, and confirms handover from their own app.

Rider console — assigned deliveries and the pickup pool.

- Auto-assignment to the nearest on-shift rider, with a fallback shared pickup pool.
- A full-screen offer (accept/reject, 60-second timer, alarm) for each new delivery.
- Cash-on-delivery collection and a code-verified (or noted) handover confirmation.
- A live stats strip: deliveries, rating, and acceptance rate.

Built for Reliability

- Card payments processed securely through Stripe; prices, totals and stock are always calculated and verified on the server, never trusted from the browser or app.
- Delivery coverage is store-by-store with a configurable radius, so the platform is ready to expand to new cities without code changes.
- The same backend serves the website and the mobile app, so they never fall out of sync.
